

LAB- ASSIGNMENT – 5.4

Name : G.Harika

Hall Ticket No. : 2303A51612

Batch No.: 05

Lab 5: Ethical Foundations – Responsible AI Coding Practices

Task Description #1:

- Prompt GitHub Copilot to generate a Python script that collects user data (e.g., name, age, email). Then, ask Copilot to add comments on how to anonymize or protect this data.

Expected Output #1:

- A script with inline Copilot-suggested code and comments explaining how to safeguard or anonymize user information (e.g., hashing emails, not storing data unencrypted).

AI Generated Code:

```
#generate a Python script that collects user data (e.g., name, age, email).
after that add comments on how to anonymize or protect this data.

# ResponsibleAI.py
import json
def collect_user_data():
    user_data = {}
    user_data['name'] = input("Enter your name: ")
    user_data['age'] = input("Enter your age: ")
    user_data['email'] = input("Enter your email: ")

    # Save the collected data to a JSON file
    with open('user_data.json', 'w') as f:
        json.dump(user_data, f)
```

```

print("User data collected and saved successfully.")

if __name__ == "__main__":
    collect_user_data()

# To anonymize or protect this data, consider the following steps:
# 1. Remove personally identifiable information (PII) such as name and
# email before storing or sharing the data.
# 2. Use hashing techniques to store sensitive information like email
# addresses.
# 3. Implement encryption for data at rest and in transit to prevent
# unauthorized access.
# 4. Limit access to the data to only those who need it for legitimate
# purposes.
# 5. Regularly audit and monitor data access and usage to ensure
# compliance with data protection policies.
# 6. Comply with relevant data protection regulations (e.g., GDPR, CCPA)
# to ensure user privacy rights are respected.
# 7. Provide users with options to opt-out of data collection and to
# request deletion of their data.

```

```

Responsible AI Documentation for RandomForestClassifier on Iris Dataset

1. Explainability:

- The RandomForestClassifier is an ensemble learning method that combines multiple decision trees to improve predictive performance and control overfitting.
- Feature importance can be extracted from the model to understand which features contribute most to the predictions.
- Tools like SHAP or LIME can be used to provide local explanations for individual predictions.

2. Accuracy Limits:

- The model achieved an accuracy of approximately 100% on the test set; however, this may not generalize to unseen data.
- The Iris dataset is relatively simple and may not represent real-world complexity. Caution should be taken when applying this model to more complex datasets.

- Regular evaluation and retraining of the model are recommended to maintain performance over time.

3. Bias and Fairness:

- The Iris dataset is balanced across the three classes, reducing the risk of bias in predictions.

- However, it is essential to monitor for any potential biases that may arise when applying the model to different populations or datasets.

4. Data Privacy:

- Ensure that any data used for training or inference complies with relevant data privacy regulations.

- Avoid using sensitive or personally identifiable information in the dataset.
